CC Novel hybridisation assay probes have been developed comprising an cligonucleotide which will hybridise under selected conditions to Human CC papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, CC 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: CC probe duplex. The present sequence represents a specifically claimed HPV CP primer (amplification oligonucleotide). Oligonucleotides are useful CC to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body CC fluid, and distinguish these from other HPV variants. Papillomaviruses and HPV Types 16 and 18 are associated with genital CC cancers. HPV PCR primers can amplify HPV Type 16 and/or 18 nucleic acid CC in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and CC detecting probe; target duplex formation; target nucleic acid is CC amplifying nucleic acids with at least one specifically claimed PCR CC amplifying nucleic acids with at least one specifically claimed PCR CC Oligonucleotides can distinguish target sequences from phylogenetically CC close HPV Types 16 and 18 whilst available detection sera react with CC antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

   Novel hybridisation assay probes have been developed comprising an oligonuclectide which will hybridise under selected conditions to Human oligonuclectide which will hybridise under selected conditions to Human papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: probe duplex. The present sequence represents a specifically claimed HPV PCR primer (amplification oligonuclectide). Oligonuclectides are useful to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body fluid, and distinguish these from other HPV variants. Papillomaviruses

CC Novel hybridisation assay probes have been developed comprising an CC oligonucleotide which will hybridise under selected conditions to Human CC oligonucleotide which will hybridise under selected conditions to Human CC papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 35, 35, 35, 45, 51, 52, or 58) target nucleic acids to form detectable target: CC probe duplex. The present sequence represents a specifically claimed HPV CP primer (amplification oligonucleotide). Oligonucleotides are useful CC to detect HPV Type 16 and/or 18 in samples e.g. cervical smears, body CC fluid, and distinguish these from other HPV variants. Papillomaviruses CC are small DNA viruses and HPV Types 16 and 18 are associated with genital CC cancers. HPV PCR primers can amplify HPV Type 16 and/or 18 nucleic acid is CC camplifying nucleic acids with at least one specifically detected by CC camplifying nucleic acids with at least one specifically detected by CC conjunctiving nucleic acids with at least one specifically claimed PCR CC conjunctiving nucleic acids with at least one specifically claimed PCR CC conjunctiving nucleic acids with at least one specifically claimed PCR conjunctiving nucleic acids with at least one specifically claimed PCR conjunctiving nucleic acids with at least one specifically claimed PCR conjunctiving nucleic acids with at least one specifically claimed PCR conjunctiving nucleic acids with at least one specifically claimed PCR conjunctiving nucleic acids with at least one specifically claimed PCR conjunctiving nucleic acids with at least one specifically claimed PCR conjunctiving nucleic acids with at least one specifically claimed PCR conjunctivities can distinguish target sequences from phylogenetically claimed PCR conjunctivity and distinguish target sequences from phylogenetically claimed PCR conjunctivities and distinguish target sequences from phylogenetically claimed PCR conjunctivity and distinguish target sequences from phylogenetically claimed PCR conjunctivities and conjunctivities and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                are small DNA viruses and HPV Types 16 and 18 are associated with genital cancers. HPV PCR primers can amplify HPV Type 16 and/or 18 nucleic acid in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe:target duplex formation; target nucleic acid is optionally amplified. Type 16 or 18 can be specifically detected by amplifying nucleic acids with at least one specifically claimed PCR primer. For Type 18 detection, a helper probe may be used. Oligonucleotides can distinguish target sequences from phylogenetically close HPV Types 16 and 18 whilst available detection sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 23; Page 34; 70pp; English
